SPECIAL RATINGS & PERFORMANCE DATA

Heater-Cycling:

Cycles of Intermittent Operation 2000 min. cycles

This test is performed on a sample lot of tubes from each production run under the following conditions: heater volts = 18.9 cycled one minute on and one minute off, heater 135 volts positive with respect to cathode, and all other elements connected to ground. At the end of this test, tubes are checked for heater-cathode shorts and open circuits.

Transconductance at Reduced Heater Voltage (Triode Unit):

Average Value. 900 μ mhos

With heater volts = 10.8, plate volts = 250, and grid volts = -3.

^a For satisfactory operation, it is recommended that the heater be operated within the voltage range of 12.0 to 15.0 volts.

^b The dc component must not exceed 100 volts.

^c Without external shield.
